MSBBSS04: Statistical programming in R

Lab: Debugging R

Work preferably in pairs and perform all commands in this practical using RStudio or the built-in R editor. Put the answers to the questions as comment in the script and add comments to your script to explain what you do, using the hash (#) sign. At the end of this document you will find instructions about how and when to hand in your work.

Exercises

Download the zip folder with this week's exercises. The folder contains three subfolders with exercises:

- `01_exercise` practice debugging your own code
- `02_exercise` practice debugging your own code with RStudio IDE features
- `03_exercise` (*optional!*) practice debugging others' code

For each exercise, you can 'choose your own adventure' by selecting the R script with more or with less hints:

- `0X_debugging_spartan.R` (directions to explore without suggested code)
- `0X_debugging_comfy.R` (directions to explore with suggested code)

Your homework is to hand in a version of exercises `01` and `02`. This may be either the `spartan` or `comfy` version of each exercise. The third exercise does not need to be handed in.

Next week, the solutions will be added:

- `0X_debugging_solution.R` (directions to explore with code solutions)

Hint

Remember to restart R as indicated. In the RStudio IDE:

- Session -> Restart R, or
- Ctrl + Shift + F10 (Windows),
- Cmd + Shift + 0 / Cmd + Shift + F10 (Mac)

Instructions for handing in your work

- Put your answers to the questions to the R script and mark the text as comment by using the hashtag (#) sign. Add comments to your script explaining what you are doing.
- Save the script file. Name the file as follows: YourNameLabXXX.R (where XXX is the topic of the week or the week number).
- Hand in the .R or .qmd file at least one day before the next class session. Do this via the learning environment.
